

Barvni kartica je izdelana na papirju, zato se pri posameznih vrstah barv navedenih na različnih opretnih in različnih tipih površine možna druga odstopanja.

Odstopanja so možna tudi zaradi različnih gradivnih, strukturalnih in tehničnih značilnosti.

Barve v različici 1 pod 25 za Akolit, Silikat in Silikon niso primerne za vstavljanje v mineralne izolacijske ploščice in ometi.

Za večje in večinske količine izdelkov se priporoča uporaba nian, ki imajo različne odstopanje manj kot 7.

Simboli

→ Kočičice (simboli) levi navedene v naslednjem delu, kažejo vam pomen, v katero odboje je možno posamezne izdelke namazati.

● Barve in ometi so silikatni in silikatni ometi uporabni le v odbojih, ki imajo od številke odzema dodan simbol ●

○ svetlobna stabilnost

† svetlost

From case to case, the colorings of this color card may vary slightly due to different types and structures of building surfaces. Regarding a particular color shade of a hardened render, there might be slight differences of the colouring from case to case due to the variations in render structure, grain sizes, and the manner of application. For technical reasons regarding the painting technique these samples may not match the paint colour exactly, but.

Colors with brightness 1 below 25 for Akolit, Silikat and Silikon are not suitable for systems with thermo-insulating boards and renders.

For larger surfaces and those strongly exposed to weather conditions, we do not recommend usage of nuances with light durability less than 7.

Simboli

→ Colourings with the last digit (0-5) are possible for the particular coating.

● Only colorings marked with an ● are available for silicate and silicate coatings.

○ Light stability

† Lightness value
